What is Anaconda?

Anaconda is a Python distribution that is particularly popular for data analysis and scientific computing

- Open source project developed by Continuum Analytics, Inc.
- Available for Windows. Mac OS X and Linux
- Includes many popular packages: NumPy, SciPy, Matplotlib, Pandas, IPython, Cython
- Includes **Spyder**, a Python development environment
- Includes conda, a platform-independent package manager

Installing Anaconda

Anaconda is easy to install

- Download installer from https://www.continuum.io/download
- Execute the installer and follow the instructions

Anaconda is installed on Yale clusters Omega and Grace

\$ module load Langs/Python/2.7-anaconda

Introduction to Conda

Simplifies installation of Python packages

- Platform-independent package manager
- Doesn't require administrative privileges
- Installs non-Python library dependencies (MKL, HDF5, Boost)
- Provides "virtual environment" capabilities
- Many channels exist that support additional packages
- Documentation at http://conda.pydata.org.docs/

Installing Python packages with Conda

It can be as easy as:

\$ conda install wxpython

Specific versions of packages can be requested:

\$ conda install wxpython=3.0

Some packages are only available in special channels:

\$ conda install -c vpython vpython

Pip can also be used:

\$ pip install intervaltree

Virtual Environments

Environments allow different versions of packages on same machine

Create environment "test" and install numpy version 1.7

\$ conda create --name test numpy=1.7

Environments must be activated

On Mac OS X and Linux:

```
$ source activate test
```

\$ python

. . .

\$ source deactivate

On Windows:

- > activate test
- > python

. . .

> deactivate

More Conda operations

Display help for conda command (and sub-commands):

```
$ conda --help
```

\$ conda list --help

List packages in current conda environment:

\$ conda list

Display all information about conda installation:

\$ conda info -a

Search for available packages (using regular expressions):

\$ conda search '^doc' # packages that start with "doc"

Update package:

\$ conda update wxpython

Uninstall package:

\$ conda remove wxpython

Warning about installing/updating packages

Installing packages into existing environment may cause problems

- best to install all necessary packages at same time
- install command may ask permission to update existing packages which may result in version conflicts
- install packages into new environments if possible to avoid conflicts
